Task 1: Log Analysis for Unauthorised Access

1. Methodology for log analysis

The log analysis process consisted of importing the provided access log file into CyberChef, which is a powerful tool for filtering and analysing text. The primary goal was to read the file and identify any signs of unauthorised activity, such as repeated failed logins, suspicious IP addresses, and irregular access patterns.

To efficiently filter the logs, a regular expression with the regex “Error” was applied, giving the ability to isolate the log entries to display all the failed access attempts. This method of filtering allowed the ability to identify HTTP 403 errors, which indicates a unauthorised access response from the server (Mozilla Foundation, 2025). Furthermore, the results revealed repeated unauthorised attempts targeting the “/admin” page from the IP address “192.168.1.15” over multiple days.

The logs were examined further, and there was a clear and consistent attack pattern of the IP address making unauthorised access attempts at a precise three-day interval at the same time. Such a structured pattern strongly suggests that the attack was automated, likely with a scheduled script, rather than the attempts being multiple manual access attempts. This strongly indicates that the attacker used a brute-force approach to finding vulnerabilities within the system.

Correlation with Task 2: USB File Access

Further investigation revealed that the same IP address (192.168.1.15) was also within the USB device logs file, which could suggest a connection between the unauthorised access attempts. There is an interesting pattern that was identified within the file log where the admin was logged into from the IP addresses increasing by five each time, for example, 192.168.1.10, 192.168.1.15, 192.168.1.20 and so on, which started from 192.168.1.10 to 192.168.1.50; this systematic increase could suggest that there is another automated script or a dynamic IP allocation technique. This could indicate an attempt of anti-forensic techniques to evade detection or bypass IP restriction.

2. Key findings

TIMESTAMP	USER ACCOUNT	IP ADDRESS
2024-02-01, 12:34:56	admin	192.168.1.15
2024-02-04, 12:34:56	admin	192.168.1.15
2024-02-07, 12:34:56	admin	192.168.1.15
2024-02-10, 12:34:56	admin	192.168.1.15
2024-02-13, 12:34:56	admin	192.168.1.15
2024-02-16, 12:34:56	admin	192.168.1.15
2024-02-19, 12:34:56	admin	192.168.1.15
2024-02-22, 12:34:56	admin	192.168.1.15
2024-02-25, 12:34:56	admin	192.168.1.15
2024-02-28, 12:34:56	admin	192.168.1.15

3. Screenshots

Arranging the access error events within a timeline allows the investigators to identify potential unseen patterns and anomalies and notice the difference between an unauthorised access attempt and file interactions. Utilising tools such as CyberChef regex filtering enables the ability to identify errors efficiently and document evidence within forensic investigations.

Task 2: Evidence Integrity and Recovery

1. Methods, tools & recovered evidence

In this forensic investigation of the Microsoft Excel file (*client.xlsx*), multiple systematic and rigorous attempts were made to decrypt this file through wordlists and dictionary-based attacks without success. The main attempts included using two widely known word lists, such as *rockyou.txt* and *10-million-password-list-top-100000*. However, further testing also included tools such as Hashcat's rule-based permutations (rule 64), which was also unsuccessful, even when combined with a custom-generated wordlist using information from the *log* file for potential passwords.

Due to the consistent failure of all of these attempts, it strongly indicates that the password is not included in a dictionary wordlist and is much more complex and highly secure. Microsoft Excel file encryption uses AES 256-bit encryption (NTNU, 2025); in turn, this means that encrypted files with large complex passwords, mixed character types, or random patterns are very unlikely to be vulnerable to dictionary word list attacks, even those with rule-based extensions.

To further confirm that the file decryption was indeed resistant to password wordlists and dictionaries, Hashcat, as a brute force approach, was used to utilise the maximum allocation of GPU usage for efficiency. However, even when attempting to guess character cases, types, and sizes, the ETA was approximately 177 days to decrypt, assuming those variables were correct. This ETA with the current resources and deadlines is unrealistic and impractical for a forensic investigation.

Using forensic best practices, the decryption of strong encryption methods can make it very secure and difficult for investigators to decrypt (XPressGuards, 2025). Therefore, allocating six months to brute force a single encrypted file is not realistic and justifiable, especially when time and resources are limited.

Overall, due to the impracticality of brute force methods, this Microsoft Excel file (*client.xlsx*) has to be considered not feasible to decrypt within the justification of time, thereby making it untrackable for forensic purposes within this investigation.

2. Summary table

File Name	client.xlsx
Original SHA-256 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ sha256sum "/home/administrator/Desktop/USB Drive/client.xlsx" b7e7da2ef44898e9f7e0072f97e0661dae58f50e2d585a1d1f5efa28377ea64b</pre>
Original MD5 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ md5sum "/home/administrator/Desktop/USB Drive/client.xlsx" 87f6dc6b6ccd015dea125450379e79cb /home/administrator/Desktop/USB Drive/client.xlsx</pre>

Recalculated SHA-256 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ sha256sum "/home/administrator/Desktop/USB Drive/client.xlsx" b7e7da2ef44898e9f7e0072f97e0661dae58f50e2d585a1d1f5efa28377ea64b</pre>
Recalculated MD5 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ md5sum "/home/administrator/Desktop/USB Drive/client.xlsx" 87f6dc6b6ccd015dea125450379e79cb /home/administrator/Desktop/USB Drive/client.xlsx</pre>
Integrity Notes	The integrity of the file is verified as the hashes match; however, due to AES 256-bit and the time limit, brute force was not practical.

File Name	financial_report.docx
Original SHA-256 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ sha256sum "/home/administrator/Desktop/USB Drive/financial_report.docx" 5273dd52554cc3b233a4f8213cf97e939fdb498e074345d6df9c58108cd7f9ee /home/admini</pre>
Original MD5 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ md5sum "/home/administrator/Desktop/USB Drive/financial_report.docx" b5ba5116856f36efe861aea87abe4e92 /home/administrator/Desktop/USB Drive/f</pre>
Recalculated SHA-256 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ sha256sum "/home/administrator/Desktop/USB Drive/financial_report.docx" 5273dd52554cc3b233a4f8213cf97e939fdb498e074345d6df9c58108cd7f9ee /home/admini</pre>
Recalculated MD5 Hash	<pre>(administrator@PenTest-Kali-2023)-[~] \$ md5sum "/home/administrator/Desktop/USB Drive/financial_report.docx" b5ba5116856f36efe861aea87abe4e92 /home/administrator/Desktop/USB Drive/f</pre>
Integrity Notes	The integrity of the file is verified as the hashes match; however, decryption was not attempted due to the focus being on the <i>client.xlsx</i> file. However, if there were more time, further attempts would be made.

The wordlist or mask that you are using is too small.
This means that hashcat cannot use the full parallel power of your device(s).
Unless you supply more work, your cracking speed will drop.
For tips on supplying more work, see: https://hashcat.net/faq/morework

4. Forensic Analysis

During this forensic investigation, the biggest challenge that was encountered was decrypting the encrypted file, which in this case was *client.xlsx*, which was encrypted with AES-256 encryption, which is well known for high integrity and security against cryptographic based attacks. Targeted wordlists were used with well-known and extensive common passwords such as *rockyou.txt* and *10-million-password-list-top-100000*, which both failed to return any indication of decryption.

Advanced techniques such as Hashcat's Rule 64 were also applied to increase the possibility of further identifying the password if the structure was more complex. Despite creating a custom wordlist using the *log* file for analysis, this approach also failed. Further, multiple attempts using hashcat were also performed with rule-based modifications; many attempts took over two days to complete, but none succeeded. A final attempt was made using the software tool '*Password Forensic Kit*', which is a powerful forensic tool that is designed to decrypt complex passwords; however, similarly, it failed to display any successful result.

The consistent failures of all of these methodologies to decrypt the file strongly suggest that the password is not included within a wordlist or dictionary-based and is more likely a sophisticated combination of characters with no pattern or lengths and are completely randomised. Brute force attack ETA time, even with full GPU utilisation, is impractical at 177 days.

In reflection, this forensic analysis highlighted the critical challenges with modern-day advanced encryption. The complexity of the encryption highlights the importance of implementing strict cybersecurity measures, such as enforcing strict password policies and maintaining detailed logs.
